DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on October 19, 2007 has been entered.

Claim Rejections - 35 USC § 103

2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
3. Claims 11 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Persson et al (US 5,778,316).

Persson et al (US 5,778,316) discloses a communication apparatus for use in a CDMA communication in which each user simultaneously uses the same radio frames (see Fig.11) of a fixed duration on a physical channel to transmit data, and the transmitted data of different users is divided between the different users by using different spreading codes allocated to respective users (see Fig.4 showing the allocation of different spreading codes W0,...W55), the apparatus comprising:

forming means for forming logical channel units each of which is to be subjected to error detection, each logical channel unit including information of a logical channel and an error detecting code added to the information (Fig. 11 shows that the logical channel, a traffic channel in this case, includes information and an error detecting CRC code); and

mapping means for mapping the logical channel unit into one or more radio frames (see Fig.15 showing a logical channel mapped to radio frames).

Persson et al fails to teach that the mapping means makes the number of radio frames of the fixed duration on the physical channel into which the logical channel unit is mapped larger in a case where a transmission rate of the physical channel is low, than that in a case where the transmission rate is high.

Since each frame would carry less amount of information when the transmission rate of the physical rate is low, it would have been obvious to one skilled in the art at the time the invention was made to increase the number of radio frames of the fixed duration on which the logical channel is mapped for the purpose of ensuring the same amount of data to be transmitted per logical channel.

Allowable Subject Matter

4. Claims 12 and 14 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin Y. Kim whose telephone number is 571-272-3039. The examiner can normally be reached on 8AM --5PM M-F.
